KEYNOTES

Project Management in Action: **UN Intelligent Wide Area Network**

The United Nations, Service for Geospatial Information and Telecommunication Technology (SGITT) adopted project management best practices for managing wide variety of projects. The Wide Area Network Section (WANS one of SGITT sections) was tasked to Improve the UN global network connectivity by using more efficiently the existent resources, reducing cost increasing capacity and improving performance. In this session we will discuss how the expressed requirements were leading to three different initiatives that were resulting in a more costly deployment of three different technical solutions and how using project management best practices is helping us to align the project objectives and actions, identifying risk and opportunities, implementing necessary adjustment, and steer toward a significant improvement outcome as expected.

Speaker:
Roberto Cruz-Flores, Chief Wide Area Network Support Section, Service for Geospatial Information and Telecommunication Technology Section (SGITT) - United Nations

PMBOK and PRINCE2: a tale of two best practices

Description: There are a range of different best practices which are applied to project management, with two of the most commonly considered being PMBOK and PRINCE2. This session will compare and contrast these two best practices and provide a useful reference to the wealth of information and guidance contained in both. Interestingly, there will be a lot to learn about their differences and their context of applicability as well as which one may work best in specific situations.

Speaker:
Marco LIUZZI - Chief, Business Solutions Section (OPB) - ICC Brindisi Office - United Nations
